## 6-SUBSTITUTED BIARYL PURINE DERIVATIVES AS POTENT CYCLIN/CDK INHIBITORS AND ANTIPROLIFERATIVE AGENTS

This application claims benefit of U.S. Provisional Patent Application  
5 Serial No. 60/124,829, filed March 17, 1999.

### FIELD OF THE INVENTION

The present invention relates to compounds that are shown to be potent  
10 cyclin/cyclin dependent kinase (cdk) inhibitors. Compounds with these properties are  
shown to be potent inhibitors of cell growth and proliferation. Such compounds can  
be used to treat the following conditions: rheumatoid arthritis, lupus, type 1 diabetes,  
multiple sclerosis, cancer, restenosis, gout and other proliferative diseases involving  
abnormal cellular proliferation. Compounds of the present invention which are biaryl  
15 substituted purine derivatives are shown to be potent antiproliferative agents against a  
number of human transformed cell lines, and also inhibitors of human cyclin/cdk  
kinase complexes.

### BACKGROUND OF THE INVENTION

20

#### Cellular Proliferation and Cancer.

The disruption of external or internal regulation of cellular growth can  
lead to uncontrolled proliferation and in cancer, tumor formation. This loss of control  
can occur at many levels and, indeed, does occur at multiple levels in most tumors.  
25 Further, although tumor cells can no longer control their own proliferation, they still  
must use the same basic cellular machinery employed by normal cells to drive their  
growth and replication.

#### Cyclin Dependent Kinases and Cell Cycle Regulation.

30

Progression of the normal cell cycle from the G1 to S phase, and from  
the G2 phase to M phase is dependent on cdks (Sherr, C.J., Science 274:1672-1677  
(1996)). Like other kinases, cdks regulate molecular events in the cell by facilitating  
the transfer of the terminal phosphate of adenosine triphosphate (ATP) to a substrate

protein. Isolated cdks require association with a second subunit, called cyclins (Desai et al., Mol. Cell. Biol., 15:345-350 (1995)). Cyclins cause conformational changes at the cdk active site, allowing ATP access and interaction with the substrate protein. The balance between its rates of synthesis and degradation controls the level of each cyclin at any point in the cycle (Elledge, S.J., et al., Biochim. Biophys. Acta, 1377:M61-M70 (1998)). The influences of cyclin/cdk activity on the cell cycle and cellular transformation are summarized in Table 1.

#### Abnormal Cyclin/cdk Activity in Cancer.

10 In a normal cell, interlocking pathways respond to the cell's external environment and internal checkpoints monitor conditions within the cell to control the activity of cyclin/cdk complexes. A reasonable hypothesis is that the disruption of normal control of cyclin/cdk activity may result in uncontrolled proliferation. This hypothesis appears to hold in a number of tumor types in which cyclins are expressed  
15 at elevated levels (Table 1). Mutations in the genes encoding negative regulators (proteins) of cyclin/cdk activity are also found in tumors (Larsen, C.-J., Prog. Cell Cycle Res., 3:109-124 (1997)); (Kamb, A., Trends in Genetics, 11:136-140 (1995)). Members of the Cip family of cdk inhibitors form a ternary complex with the cyclin/cdk and require binding to cyclinA, cyclinE, or cyclinD (Hall, M., et al.,  
20 Oncogene, 11:1581-1588 (1995)). In contrast, Ink family members form a binary complex with cdk4 or cdk6 and prevent binding to cyclinD (Parry, D., et al., EMBO J., 14:503-511 (1995)).

#### 5 Inhibitors of Cyclin/cdk Complexes as Potential Anticancer Agents.

Tumors with elevated cyclin/cdk activity, whether from the over expression of cyclins or the loss of an endogenous cdk inhibitor, are prime targets for potential therapies based on small molecule cyclin/cdk inhibitors. In fact, several small molecule inhibitors of cyclin/cdks are reported (Meijer, L.; et al., "Progress in  
 10 Cell Cycle Research," Plenum Press: New York, 351-363 (1995)) and appear to bind at the ATP site of the kinase. Some information is known about small molecule inhibitors of other kinases, such as PKC (serine kinase) (Murray, K.J. et al., "Ann. Rep. Med. Chem.," J. Bristol, Ed., Academic Press, Inc.: New York, Chapter 26 (1994)) and tyrosine kinases (Fantl, W.J.; et al., Ann. Rev. Biochem., 62:453 (1993);  
 15 Burke, T.R., Drugs of the Future, 17:119-1131 (1992); Dobrusin, E.M. et al., "Ann.

Rep. Med. Chem." J. Bristol, Ed., Academic Press, Inc.; New York, Chapter 18 (1992); Spence, P., Curr. Opin. Ther. Patents, 3:3 (1993)). A number of known inhibitors were obtained from commercial sources or were synthesized by literature procedures.

#### Purine Compounds as Cyclin/cdk Inhibitors.

There are several reports of 2,6-diamino substituted purine derivatives as cyclin/cdk inhibitors and as inhibitors of cellular proliferation. Among those are reports by U.S. Patent No. 5,583,137 to Coe, et al., olomoucine (Vesely, J., et al., Eur. J. Biochem., 224:771-786 (1994)), roscovitine (Meijer, L., Eur. J. Biochem., 243:527-536 (1997)), WO 97/16452 to Zimmerman, Imbach, P., et al., Bioorg. Med. Chem. Lett., 9:91-96 (1999), Norman, T.C., et al., J. Amer. Chem. Soc., 118:7430-7431 (1996), Gray, N.S., et al., Tetrahedron Lett., 38:1161-1164 (1997), Gray, N.S., et al., Science, 281:533-538 (1998), WO 98/05335 to Lum, et al., Schow, S.R., et al., Bioorg. Med. Chem. Lett., 7:2697-2702 (1997), US Patent No., 5,886,702 to Mackman, et al., Nugiel, D.A., et al., J. Org. Chem., 62:201-203 (1997), and Fiorini, M.T. et al., Tetrahedron Lett., 39:1827-1830 (1998). Many of these reported compounds are shown to inhibit cyclin/cdk complexes and have modest cellular proliferation inhibition properties.

The compounds of the present invention are shown to have far superior biological activities as cyclin/cdk complex inhibitors as well as inhibitors of cellular proliferation compared to those previously reported. In fact, the art (e.g., Fiorini, M.T. et al., Tetrahedron Lett., 39:1827-1830 (1998)) teaches away from compounds of this invention, claiming lack of cellular proliferation inhibition.

15 with a compound of the formula: R<sub>2</sub>-B(OH)<sub>2</sub>, R<sub>2</sub>-Sn(n-Bu)<sub>3</sub>, R<sub>2</sub>-Sn(Me)<sub>3</sub>, or mixtures thereof, under conditions effective to form the purine derivative compound.

The compounds of the present invention, as described in Formula I, show significantly improved growth inhibition of human transformed cell lines and/or cyclin/cdk inhibition relative to compounds of the prior art. These compounds have  
20 been demonstrated to be potent growth inhibitors in dozens of human transformed cell lines. Olomoucine, a structurally related purine derivative, is a poor human transformed cell growth inhibition agent with GI<sub>50</sub> values in the 20,000-100,000 nM range over 60-transformed cell lines. By contrast, the compounds of the present invention demonstrate GI<sub>50</sub> values over 60-transformed cell lines in the <10-25,000

nM range, preferably in the <10-100 nM range over 60-transformed cell lines, and, most preferably, <10 nM across 60-human transformed cell lines. This finding is unexpected from the prior art, which specifically teaches that compounds of the present invention would not be potent human transformed cell line growth inhibitors.

5           The R<sub>2</sub> group in Formula I imparts unexpected and significant improvement in growth inhibition in human transformed cell lines, while substitution of various groups at R<sub>3</sub> and R<sub>4</sub> found in Formula I impart important features that contribute to cyclin/cdk inhibition and growth inhibition of human transformed cell lines. Specifically, the combination of the R<sub>2</sub> group and the substitutions within R<sub>3</sub> and R<sub>4</sub> result in compounds with superior biological activity. Compounds which are  
10           cyclin/cdk inhibitors and/or human transformed cell line growth inhibitors have utility in treating human proliferative cellular disorders.

In another embodiment, the present invention is directed to a method for inhibiting cellular proliferation in mammals comprising administering a therapeutically effective amount of the compound of the present invention to the mammal.

30 The compounds of the present invention can be administered orally, parenterally, for example, subcutaneously, intravenously, intramuscularly, intraperitoneally, by intranasal instillation, or by application to mucous membranes, such as, that of the nose, throat, and bronchial tubes. They may be administered alone or with suitable pharmaceutical carriers, and can be in solid or liquid form such as, 35 tablets, capsules, powders, solutions, suspensions, or emulsions.

Based on the results obtained in the standard pharmacological test procedures described below, the compounds of the present invention are useful as antineoplastic agents. More particularly, the compounds of the present invention are useful for inhibiting the growth of neoplastic cells, causing cell death of neoplastic 40 cells, and eradicating neoplastic cells. The compounds of the present invention are, therefore, useful for treating solid tumors, including sarcomas and carcinomas, such

as astrocytomas, prostate cancer, breast cancer, small cell lung cancer, and ovarian cancer, leukemias, lymphomas, adult T-cell leukemia/lymphoma, and other neoplastic disease states.

5 In addition to the utilities described above, many of the compounds of the present invention are useful in the preparation of other compounds.

The active compounds of the present invention may be orally administered, for example, with an inert diluent, or with an assimilable edible carrier, or they may be enclosed in hard or soft shell capsules, or they may be compressed into tablets, or they may be incorporated directly with the food of the diet. For oral  
10 therapeutic administration, these active compounds may be incorporated with excipients and used in the form of tablets, capsules, elixirs, suspensions, syrups, and the like. Such compositions and preparations should contain at least 0.1% of active compound. The percentage of the compound in these compositions may, of course, be varied and may conveniently be between about 2% to about 60% of the weight of  
15 the unit. The amount of active compound in such therapeutically useful compositions is such that a suitable dosage will be obtained. Preferred compositions according to the present invention are prepared so that an oral dosage unit contains between about 1 and 250 mg of active compound.

The tablets, capsules, and the like may also contain a binder such as  
20 gum tragacanth, acacia, corn starch, or gelatin; excipients such as dicalcium phosphate; a disintegrating agent such as corn starch, potato starch, alginic acid; a lubricant such as magnesium stearate; and a sweetening agent such as sucrose, lactose, or saccharin. When the dosage unit form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier such as a fatty oil.

25 Various other materials may be present as coatings or to modify the physical form of the dosage unit. For instance, tablets may be coated with shellac, sugar, or both. A syrup may contain, in addition to active ingredient, sucrose as a sweetening agent, methyl and propylparabens as preservatives, a dye, and flavoring such as cherry or orange flavor.

30 These active compounds may also be administered parenterally. Solutions or suspensions of these active compounds can be prepared in water suitably mixed with a surfactant such as hydroxypropylcellulose. Dispersions can also be

prepared in glycerol, liquid polyethylene glycols, and mixtures thereof in oils.

Illustrative oils are those of petroleum, animal, vegetable, or synthetic origin, for example, peanut oil, soybean oil, or mineral oil. In general, water, saline, aqueous dextrose and related sugar solution, and glycols such as, propylene glycol or  
5 polyethylene glycol, are preferred liquid carriers, particularly for injectable solutions. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous  
10 preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and must be fluid to the extent that easy syringability exists. It must be stable under the conditions of manufacture and storage and must be preserved against the contaminating action of microorganisms, such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol  
15 (e.g., glycerol, propylene glycol, and liquid polyethylene glycol), suitable mixtures thereof, and vegetable oils.

The compounds of the present invention may also be administered directly to the airways in the form of an aerosol. For use as aerosols, the compounds of the present invention in solution or suspension may be packaged in a pressurized  
20 aerosol container together with suitable propellants, for example, hydrocarbon propellants like propane, butane, or isobutane with conventional adjuvants. The materials of the present invention also may be administered in a non-pressurized form such as in a nebulizer or atomizer.

Transition metal-mediated cross-coupling reaction of purines of **Formula IX** with boronic acid ( $R_2-B(OH)_2$ ) or tin reagents ( $R_2-Sn(n-Bu)_3$  or  $R_2-SnMe_3$ ) provides purines of **Formula X**. If in **Formula X** ( $Y=NH_2$ ), then subsequent reaction of **Formula X** ( $Y=NH_2$ ) with acid chloride ( $R_3COCl$ ), or sulfonyl chloride ( $R_3SO_2Cl$ ),  
 10 or isocyanate ( $R_3NCO$ ), or chloroformate ( $ClC(O)OR_6$ ) reagents provides purines of **Formula XI** wherein  $Y=NHC(O)R_3$ ,  $NHSO_2R_3$ , or  $NHC(O)NHR_3$ , or  $NHC(O)OR_6$ , respectively. On the other hand, if in **Formula X**,  $Y$  already is  $OR_1$  or  $NHC(O)R_3$  or  $NHSO_2R_3$  or  $NHC(O)NHR_3$  or  $NHC(O)OR_6$ , as a result of what  $Y$  started out as in **Formula VIII**, then this last step is unnecessary.

## EXAMPLES

Proton NMR spectra were obtained on a Bruker AC 300 spectrometer at 300 MHz or a Bruker 500 MHz spectrometer and were referenced to tetramethylsilane as an internal standard. The IR spectrometer used was a single beam Perkin-Elmer Spectrum 1000 FT-IR. All IR spectra obtained were prepared in a pressed disc of KBr. All IR spectra obtained were acquired with a total of 4 accumulations at a resolution of  $4.00\text{ cm}^{-1}$ . Melting points were obtained on a Mel-Temp II apparatus and are uncorrected. Mass spectra were obtained on either a Shimadzu QP-5000 or a PE Sciex API 150 Mass Spectrometer.

**Example 1 - Preparation of Compound 2**

To the starting material 1 (1.0 g, 5.29 mmol) was added 4-bromobenzylamine (2.53 g, 11.4 mmol), and EtOH (11 mL). The mixture was stirred and heated at  $50\text{ }^{\circ}\text{C}$  in a round-bottomed flask and then  $\text{H}_2\text{O}$  (1 mL) and EtOH (10 mL) were added to dissolve the solids. The mixture was refluxed for 1 h. Hünig's base (3.68 mL, 21.2 mmol) was added and refluxed overnight, during which time a precipitate formed. The solution was filtered to provide a light yellow solid. The solid was dried *in vacuo* (1.08 g, 60%):  $^1\text{H}$  NMR (300 MHz,  $\text{DMSO}-d_6$ )  $\delta$  8.75 (bs, 1 H), 8.15 (s, 1 H), 7.52 (d, 2 H), 7.30 (d, 2 H), 4.63 (bs, 2 H); CI MS  $m/z = 340$  [ $\text{C}_{12}\text{H}_9\text{BrClN}_5+\text{H}$ ] $^+$ .

**Example 2 - Preparation of Compound 3**

To the starting material 2 (1.08 g, 3.19 mmol) was added DMSO (11 mL),  $\text{K}_2\text{CO}_3$  (2.20 g, 15.95 mmol), and 2-iodopropane (1 mL, 9.57 mmol). #### **A. Immunopurification of CyclinA/cdk2 and CyclinE/cdk2 Complexes.**

CyclinA/cdk2 and cyclinE/cdk2 assays were carried out with cyclin/cdk complexes isolated from HeLa S-3 suspension cultures. HeLa cells were grown in spinner flasks at 37 °C in Joklik's modified minimum essential media (MEM) supplemented with 7% horse serum. After growing in medium supplemented with 2 mM thymidine for 16-18 h, cultures were arrested at the G1/S border and cyclinA/cdk2 and cyclinE/cdk2 were isolated from cell lysates by immunoprecipitation with antibodies specifically directed against each cyclin subunit. Rabbit anti-cyclinA (H-432) and the mouse monoclonal antibody against cyclinE (HE111) were purchased from Santa Cruz Biotechnology. Cells blocked at the appropriate stage of the cell cycle were disrupted in lysis buffer (50 mM Tris, pH 8.0, 250 mM NaCl, 0.5% NP-40 plus protease and phosphatase inhibitors) and centrifuged at 10,000 x g to remove insoluble material. To isolate cyclin/cdk complexes, 1 µg of anti-cyclin antibody was incubated with lysate from  $1 \times 10^7$  cells for 1 h at 4 °C. Protein A-coated agarose beads were then added for 1 h to collect antibody-bound immune complexes. The immobilized cyclin/cdk complexes were then washed 4 x with lysis buffer to reduce nonspecific protein binding. The complexes were then washed 1 x in kinase assay buffer (50 mM Tris-HCl, pH 7.4, 10 mM MgCl<sub>2</sub>, 1 mM DTT) and aliquoted into individual assay tubes.

20

#### **B. Immunopurification of CyclinB/cdk1 Complex.**

HeLa cells are blocked at the G1/S border by culturing in the presence of 2 mM thymidine for 20 h. The cells are then rinsed 3x in phosphate buffered saline and resuspended in regular medium. After 4 h of culture, the mitotic blocker, nocodazole is added to a final concentration of 75 ng/ml. Sixteen hours later, the cells are harvested by centrifugation, washed in PBS, and lysed in cold Lysis Buffer (50 mM Tris pH 8.0, 250 mM NaCl, 0.5% NP-40, 1 mM DTT, 25 µg/ml leupeptin, 25 µg/ml aprotinin, 15 µg/ml benzamidine, 1 mM PMSF, 50 mM sodium fluoride, 1 mM

30

sodium orthovanadate) for 15 min at  $1 \times 10^7$  cells/ml. The lysate is then clarified by centrifugation at  $10,000 \times g$  for 10 min. The supernatant is collected and diluted 1:5 with Lysis Buffer. Monoclonal antibody against cyclinB (GNS1) is added to the supernatant to a final concentration of 5  $\mu\text{g/ml}$  and shaken at 4 °C for 2 h. The  
5 immune complexes are then collected by the addition of 200  $\mu\text{l}$  of protein agarose beads for 1 h. The beads are washed 4x in lysis buffer and 1x in kinase assay buffer.

### C. Protein Kinase Assays and Determination of $\text{IC}_{50}$ Values.

CyclinA/cdk2 assays were carried out with complexes isolated from  $0.5 \times 10^6$  cells. CyclinE/cdk2 assays were carried out with complexes isolated from  $4 \times 10^6$  cells. CyclinB/cdk1 assays were carried out with complexes isolated from  $4 \times 10^4$  cells. After centrifugation, the wash buffer was removed and the complexes resuspended in 15  $\mu\text{l}$  of kinase assay buffer (kinase wash buffer + 167  $\mu\text{g/ml}$  histone H1). Compounds being tested for inhibition were added prior to the addition of [ $\gamma$   
10  $^{32}\text{P}$ ] ATP to a final concentration of 15  $\mu\text{M}$ . The tubes were incubated at 30 °C for 5 min and the reactions were stopped by the addition of an equal volume of 2 x SDS-PAGE sample buffer. The samples were then subjected to electrophoresis on 10% SDS-PAGE to resolve the histone H1 from other reaction components. The amount of radioactive phosphate transferred to histone H1 was quantified on a Storm  
15 Phosphorimager (Molecular Dynamics).

20 Prior to the protein kinase assay, test compounds were dissolved in DMSO at a concentration of 25 mM and were diluted to produce final concentrations of 0.1, 1.0, and 10.0  $\mu\text{M}$  in the kinase assays. To eliminate possible effects of differences in DMSO concentration, the DMSO was kept constant at 0.04%, including the control reaction. Duplicate assays were performed at each concentration. The  
25 activity was plotted as the percent of activity in the absence of added test compound versus test compound concentration.  $\text{IC}_{50}$  values were calculated using GraphPad Prism data analysis software.

### D. Measuring the Inhibition of Cell Growth.

Growth inhibition ( $\text{GI}_{50}$ ) values were measured with HeLa S-3 cells  
30 selected for growth on plastic. The procedure was based on the protocol of Skehan *et al.* (Skehan, P., *et al.*, J. Natl. Cancer Inst., 82:1107-1112 (1990), which is hereby incorporated by reference) HeLa cells were plated at  $2 \times 10^4$  cells/well in 96 well

plates. One day later, a control plate was fixed by addition of TCA to 5%. After five rinses with tap water the plate was air dried and stored at 4 °C. Test compounds were added to the remaining plates at 10-fold dilutions between 0.01 and 100 µM. Two days later all plates were fixed as described above. Cells were then stained by the addition of 100 µl per well of 0.4% sulforhodamine B (SRB) in 1% acetic acid for 30 min at 4 °C. Wells were then quickly rinsed 5 x with acetic acid (1%) and allowed to air dry. The SRB was then solubilized by the addition of 100 µl per well of unbuffered 10 mM Tris base. Dye was quantified by measuring absorbance at 490 nm on a Molecular Devices kinetic microplate reader. Growth at each inhibitor concentration relative to the untreated control was calculated according to the following equation: percent growth =  $100 \times (T - T_0) / (C - T_0)$ , where T was the average optical density (OD) of the test wells after 2 days of treatment.  $T_0$  was the average OD of the wells in the control plate on day 0 and C was the average OD of untreated wells. Plots of percent growth versus inhibitor concentration were used to determine the  $GI_{50}$ .

The data below shown in Table 2 summarizes the *in vitro* cyclin/cdk inhibition constants ( $IC_{50}$ ) and growth inhibition constants ( $GI_{50}$ ) of HeLa Cells for the compounds of the current invention. Replicate experimental results are summarized below.

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US 00/07065

### Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  

Although claims 66-71 and 73-8 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
